Starrett Construction
Healthy Buildings

This project integrated sustainable strategies, with usage reduction as a priority, solution-based innovative technology, and renewable energy as a source to increase building resiliency and production of the building's energy. The design attributes included a tightly secure exterior envelop, increased internal efficiency with systems, daylighting, integrated control strategies, renewable energy applications, and the use of reused materials on the interiors. All appliances were energy-star rated and 75% of all construction, demo, and packaging was recycled or salvaged. Furniture specifications for the project included between 76-81% recycled content. This project has been awarded LEED Platinum by the GBCI.
